

Data Appendix

Contents and Notes

This data appendix includes supplementary information for the models estimated in “Buying Support and Buying Time: The Effect of Regime Consolidation on Public Goods Provision.”

The first section includes likelihood ratio tests on the 15 public goods models. These models are estimated using ordinary least squares regression with fixed effects for region-year. For the small model, the dependent variable is the public good and the independent variables are coalition size (W), constraints on executive power, population (logged), and per capita GDP (logged). The large model includes these variables as well as regime tenure and the interaction of regime tenure and coalition size. When the large model has a lower Akaike’s Information Criterion (AIC), then the additional degrees of freedom used by the large model are justified by the increased variance explained.

A second section provides the results of the models for the fifteen measures of public goods provision: civil liberties, political rights, education expenditures, health expenditures, welfare expenditures, illiteracy, educational attainment, human capital stock, life expectancy, infant mortality rates, death rate, physicians per 1000, measles immunizations rate, DPT immunizations rate, and hospital beds per 1000. Five models are included for each of these variables: the main analysis (ordinary least squares regression with region-year fixed effects), the same model with per capita income excluded, a general estimating equation (GEE), a sub-sample analysis that excludes Europe, and the main analysis with imputed data. Below the coefficients estimated by these models I present the point estimates for regimes at various levels of coalition size and regime tenure. Other controls are held at their means. Four figures are included for each of these fifteen dependent variables. The data for these models are derived from the main analysis. The figures are: (1) the effect of consolidation on the public good among inclusive regimes, (2) the effect of consolidation on the public good among exclusive regimes, (3) the effect of consolidation on the marginal effect of inclusive government on public goods provision, and finally (4) the effect of consolidation on the public good for each value of coalition size (W).

The third section is a comprehensive do file for the aforementioned tests and figures.

If you have questions, please contact me at [email address].
